The medulla, located in the brainstem above the spinal cord, is a major site in the brain for regulating autonomic nerve outflow to the heart and blood vessels, and is particularly important for short-term feedback regulation of arterial pressure. The medulla contains cell bodies for the two main divisions of the autonomic nervous system - sympathetic and parasympathetic.

Cardiac stimulation. Sympathetic activation of the heart causes an increase in heart rate and inotropy via the release of norepinephrine acting primarily upon β 1-adrenoceptors. The increase in inotropy by sympathetic activation, however, may not be sufficient to restore normal inotropy in ventricles having systolic dysfunction. Inotropic responses are also blunted because of down regulation of ...

Mitral valve prolapse is the most common abnormality of the heart valve. Most people with mitral valve prolapse do not have symptoms or signs, and do not require treatment. However, when symptoms of mitral valve prolapse or complications do occur, they include anxiety, sharp chest pain, palpitations, and migraines. Some people may need medications, and rarely, surgery to repair the heart valve.

Multiple system atrophy- parkinsonian type (MSA-P) is a rare condition that causes symptoms similar to Parkinson disease. However, people with MSA-P have more widespread damage to the part of the nervous system that controls important functions such as heart rate, blood pressure, and sweating.

In biology, homeostasis is the state of steady internal physical and chemical conditions maintained by living systems. This dynamic state of equilibrium is the condition of optimal functioning for the organism and includes many variables, such as body temperature and fluid balance, being kept within certain pre-set limits (homeostatic range). Other variables include the pH of extracellular ...

Some antihypertensive drugs, most notably beta-blockers, depress heart rate and contractility (this decreases stroke volume) by blocking the influence of sympathetic nerves on the heart.

Multiple system atrophy (MSA) is a rare neurodegenerative disorder characterized by autonomic dysfunction, tremors, slow movement, muscle rigidity, and postural instability (collectively known

as parkinsonism) due to dysfunction of the basal ganglia, and ataxia. This is caused by progressive degeneration of neurons in several parts of the brain including the basal ganglia, inferior olivary ...

Postural orthostatic tachycardia syndrome (POTS) is a condition characterized by too little blood returning to the heart when moving from a lying down to a standing up position (orthostatic intolerance). Orthostatic Intolerance causes lightheadedness or fainting that can be eased by lying back down. In people with POTS, these symptoms are also accompanied by a rapid increase in heart rate.

Excerpted from Migraine Brains and Bodies.. Head and Neck Pain are common expressions of myofascial dysfunction yet chronic headache sufferers tend to respond badly to diagnoses of "tension" or "muscle tension headache." The labels of "vascular" headache or "neurological disease" seem more respectable, more likely to be taken seriously.

Cardiac rhythms arising from the atrioventricular (AV) junction occur as an automatic tachycardia or as an escape mechanism during periods of significant bradycardia with rates slower than the intrinsic junctional pacemaker. The AV node (AVN) has intrinsic automaticity that allows it to initiate and depolarize the myocardium during periods o...
